# CHIP CONTROL FOR TURNING

## CHIP BREAKING CONDITIONS IN STEEL TURNING

Type	A Type	B Type	C Type	D Type	E Type
Small Depth of Cut $d < 7\text{mm}$					
Small Depth of Cut $d=7\text{--}15\text{mm}$					
Curl Length I	Curless	$I \geq 50\text{mm}$	$I \leq 50\text{mm}$ 1–5 Curl	$\approx 1$ Curl	Less Than 1 Curl Half a Curl
Note	<ul style="list-style-type: none"> <li>● Irregular continuous shape</li> <li>● Tangle around tool and workpiece</li> </ul>	<ul style="list-style-type: none"> <li>● Regular continuous shape</li> <li>● Long chips</li> </ul>	Good	Good	<ul style="list-style-type: none"> <li>● Chip scattering</li> <li>● Chattering</li> <li>● Poor finished surface</li> <li>● Maximum</li> </ul>

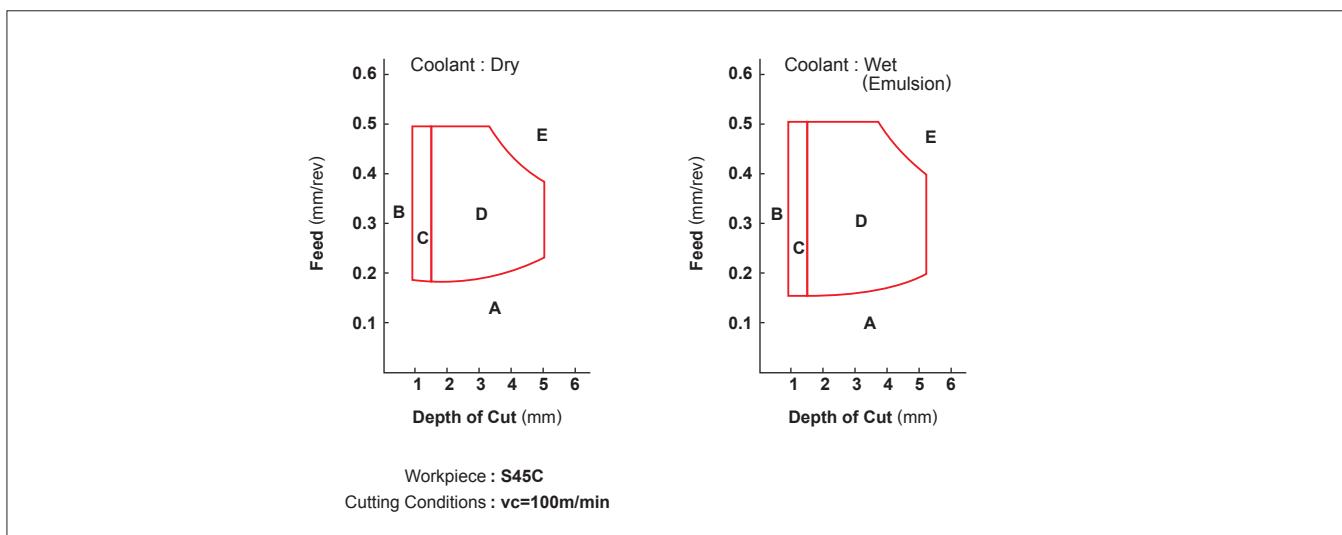

## Cutting speed and chip control range of chip breaker

In general, when cutting speed increases, the chip control range tends to become narrower.

## Effects of coolant on the chip control range of a chip breaker

If the cutting speed is the same, the range of chip control differs according to whether coolant is used or not.

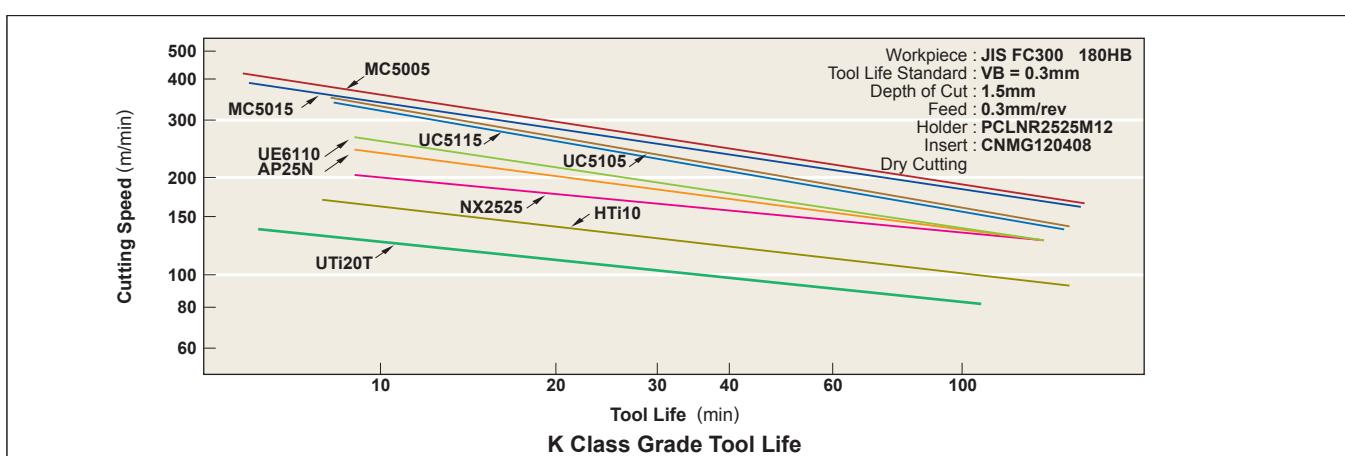

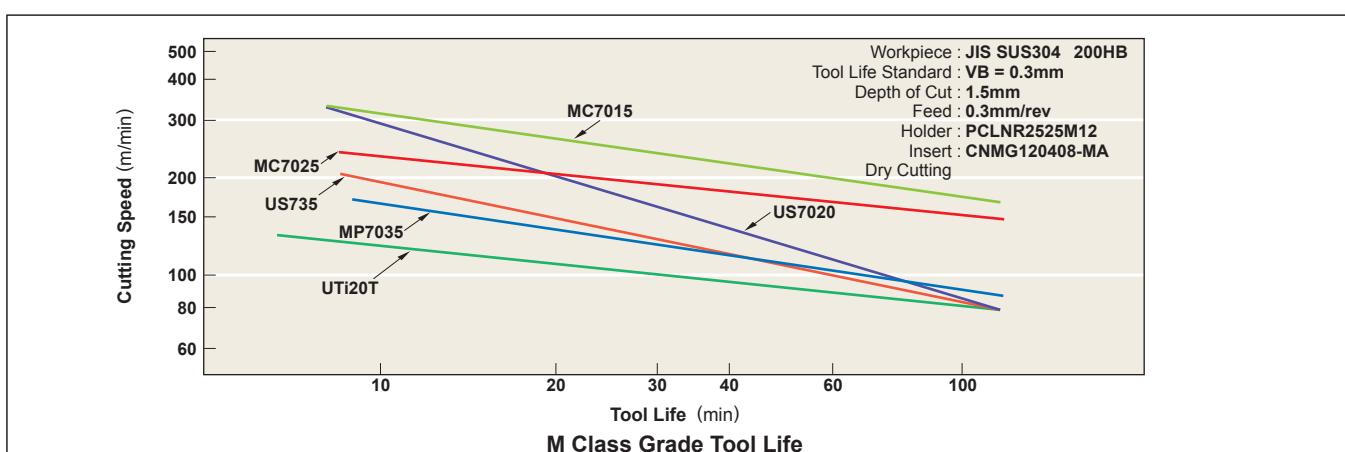

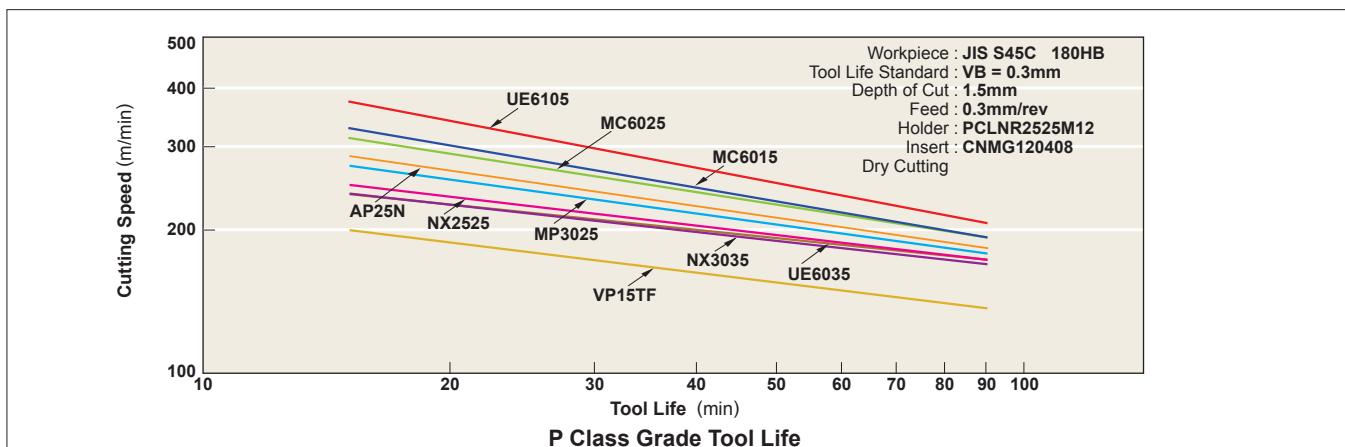

# EFFECTS OF CUTTING CONDITIONS FOR TURNING

## EFFECTS OF CUTTING CONDITIONS

Ideal conditions for cutting are short cutting time, long tool life, and high cutting accuracy. In order to obtain these conditions, selection of efficient cutting conditions and tools, based on work material, hardness, shape and machine capability is necessary.

## CUTTING SPEED

Cutting speed effects tool life greatly. Increasing cutting speed increases cutting temperature and results in shortening tool life. Cutting speed varies depending on the type and hardness of the work material. Selecting a tool grade suitable for the cutting speed is necessary.

### Effects of Cutting Speed

1. Increasing cutting speed by 20% decreases tool life by 50%. Increasing cutting speed by 50% decreases tool life by 80%.
2. Cutting at low cutting speed (20–40m/min) tends to cause chattering. Thus, tool life is shortened.

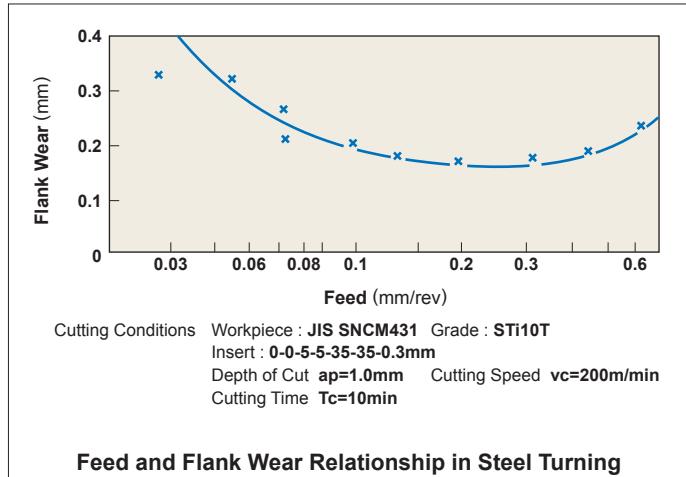

# EFFECTS OF CUTTING CONDITIONS FOR TURNING

## FEED

When cutting with a general type holder, feed is the distance a holder moves per workpiece revolution. When milling, feed is the distance a machine table moves per cutter revolution divided by the number of inserts. Thus, it is indicated as feed per tooth. Feed rate relates to finished surface roughness.

### Effects of Feed

- Decreasing feed rate results in flank wear and shortens tool life.
- Increasing feed rate increases cutting temperature and flank wear. However, effects on the tool life is minimal compared to cutting speed.
- Increasing feed rate improves machining efficiency.

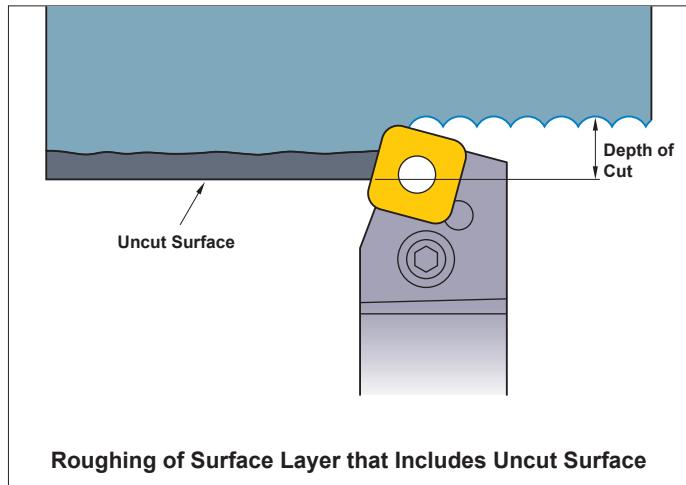

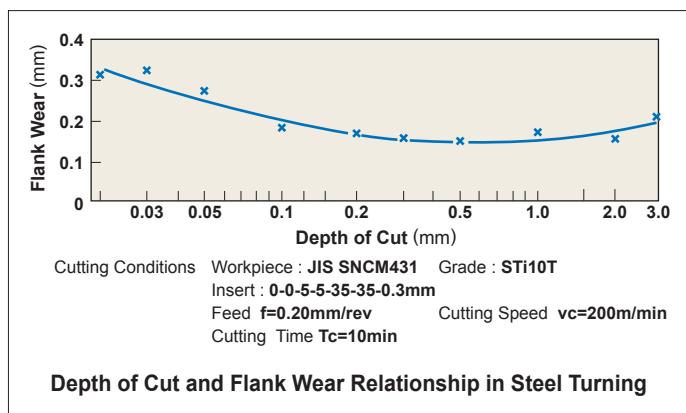

## DEPTH OF CUT

Depth of cut is determined according to the required stock removal, shape of workpiece, power and rigidity of the machine and tool rigidity.

### Effects of Depth of Cut

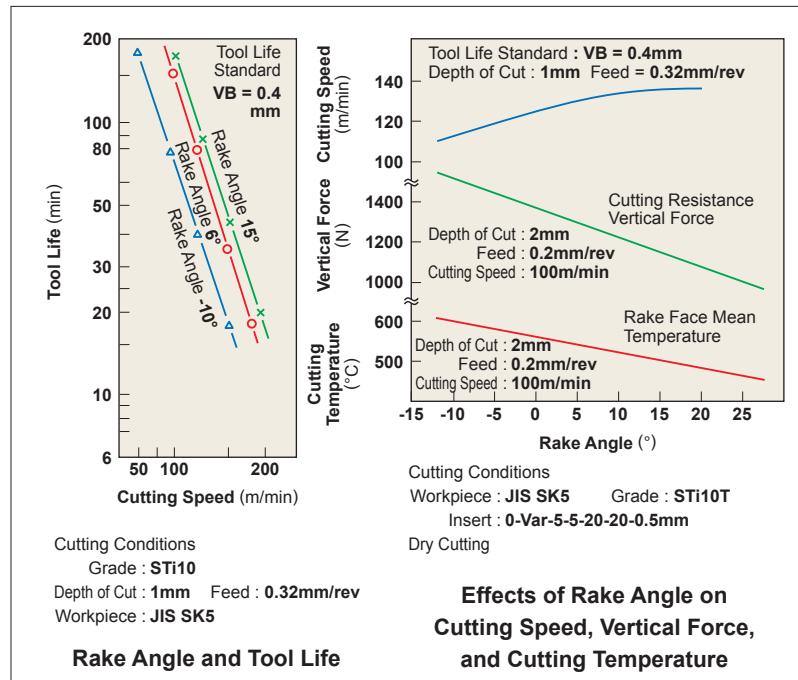

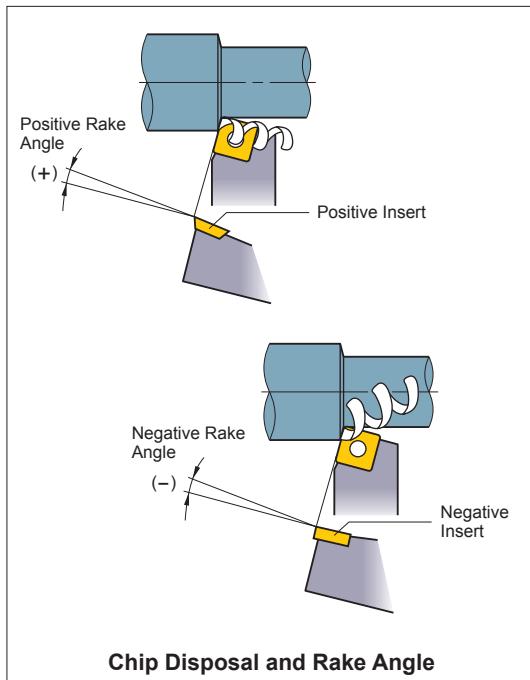

- Changing depth of cut doesn't effect tool life greatly.
- Small depths of cut result in friction when cutting the hardened layer of a workpiece. Thus tool life is shortened.
- When cutting uncut surfaces or cast iron surfaces, the depth of cut needs to be increased as much as the machine power allows in order to avoid cutting impure hard layers with the tip of cutting edge to prevent chipping and abnormal wear.

# FUNCTION OF TOOL FEATURES FOR TURNING

## RAKE ANGLE

Rake angle is cutting edge angle that has a large effect on cutting resistance, chip disposal, cutting temperature and tool life.

## Effects of Rake Angle

- Increasing rake angle in the positive (+) direction improves sharpness.
- Increasing rake angle by 1° in the positive (+) direction decreases cutting power by about 1%.
- Increasing rake angle in the positive (+) direction lowers cutting edge strength and in the negative (-) direction increases cutting resistance.

## When to Increase Rake Angle in the Negative (-) Direction

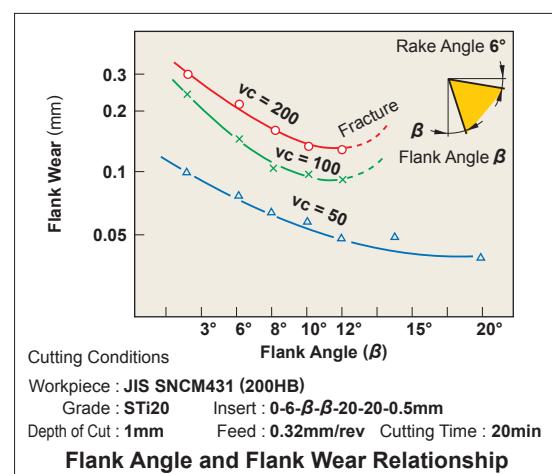

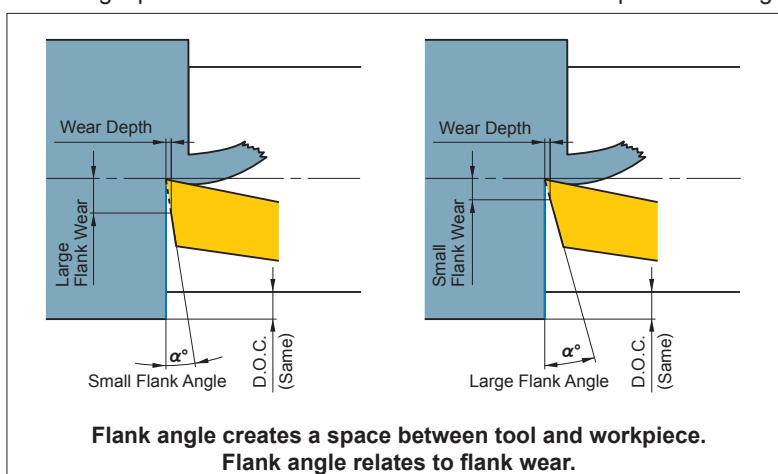

- Hard workpieces.
- When the cutting edge strength is required such as for uncut surfaces and interrupted cutting.

## When to Increase Rake Angle in the Positive (+) Direction

- Soft workpieces.
- Workpiece is easily machined.
- When the workpiece or the machine have poor rigidity.

## FLANK ANGLE

Flank angle prevents friction between flank face and workpiece resulting in smooth feed.

## Effects of Rake Angle

- Increasing flank angle decreases flank wear occurrence.
- Increasing flank angle lowers cutting edge strength.

## When to Decrease Flank Angle

- Hard workpieces.
- When cutting edge strength is required.

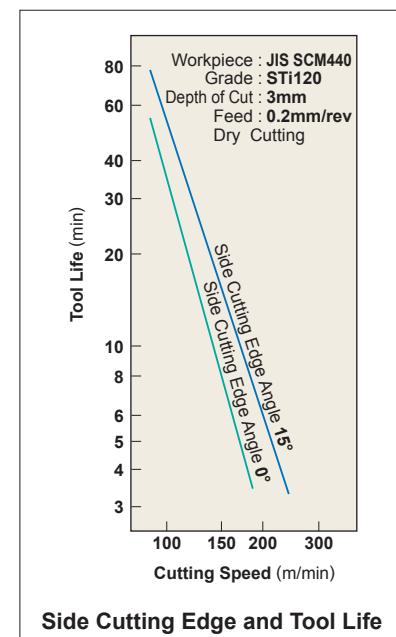

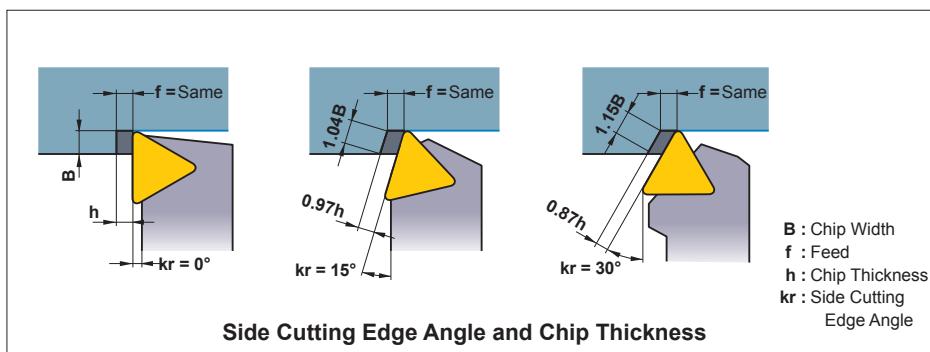

## When to Increase Flank Angle

- Soft workpieces.
- Workpieces suffer from work hardening easily.

# FUNCTION OF TOOL FEATURES FOR TURNING

## SIDE CUTTING EDGE ANGLE (LEAD ANGLE)

The side cutting edge angle reduces impact load and effects the amount of feed force, back force and chip thickness.

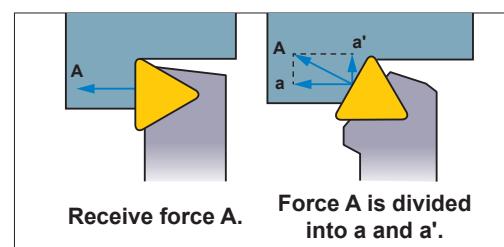

### Effects of Side Cutting Edge Angle (Lead Angle)

- At the same feed rate, increasing the side cutting edge angle increases the chip contact length and decreases chip thickness. As a result, the cutting force is dispersed on a longer cutting edge and tool life is prolonged. (Refer to the chart.)
- Increasing the side cutting edge angle increases force  $a'$ . Thus, thin, long workpieces suffer from bending in some cases.
- Increasing the side cutting edge angle decreases chip control.
- Increasing the side cutting edge angle decreases the chip thickness and increases chip width. Thus, breaking chips is difficult.

When to Decrease Lead Angle
<ul style="list-style-type: none"> <li>○ Finishing with small depth of cut.</li> <li>○ Thin, long workpieces.</li> <li>○ When the machine has poor rigidity.</li> </ul>

When to Increase Lead Angle
<ul style="list-style-type: none"> <li>○ Hard workpieces which produce high cutting temperature.</li> <li>○ When roughing a workpiece with large diameter.</li> <li>○ When the machine has high rigidity.</li> </ul>

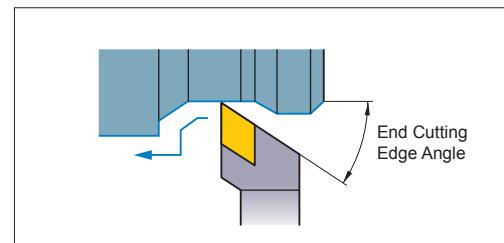

## END CUTTING EDGE ANGLE

The end cutting edge angle avoids interference between the machined surface and the tool (end cutting edge). Usually  $5^\circ - 15^\circ$ .

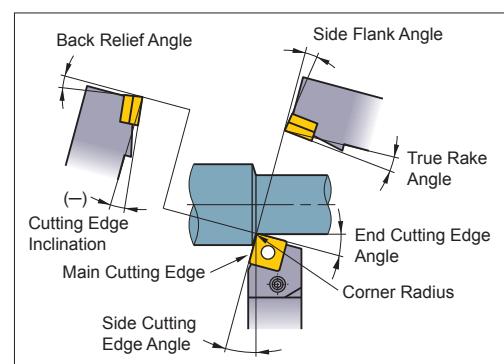

### Effects of End Cutting Edge Angle

- Decreasing the end cutting edge angle increases cutting edge strength, but it also increases cutting edge temperature.
- Decreasing the end cutting edge angle increases the back force and can result in chattering and vibration while machining.
- Small end cutting edge angle for roughing and large angle for finishing are recommended.

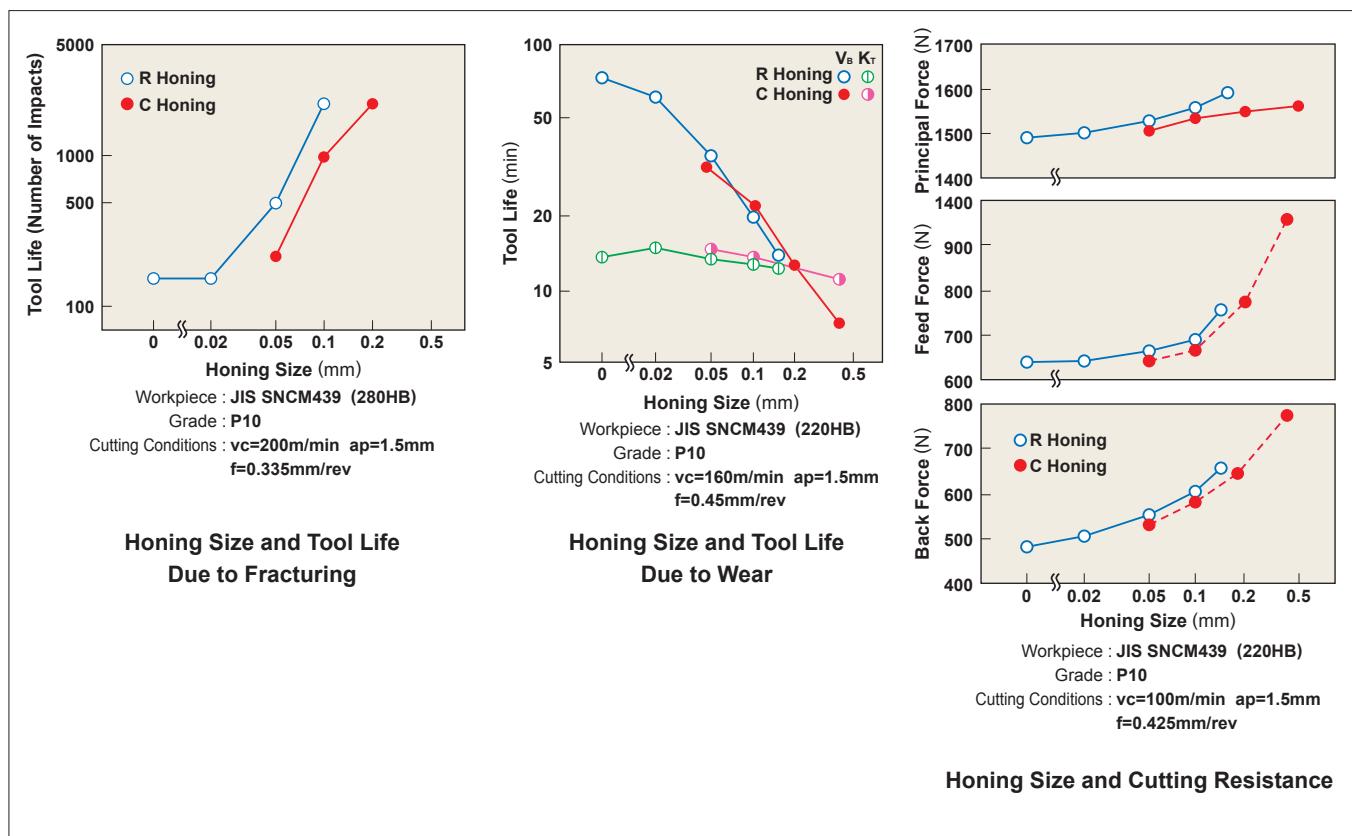

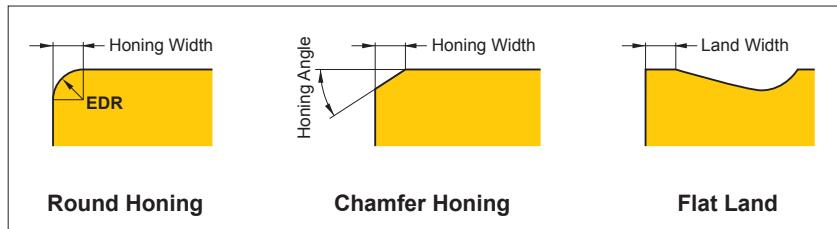

## CUTTING EDGE INCLINATION

Cutting edge inclination indicates inclination of the rake face. During heavy cutting, the cutting edge receives an extremely large shock at the beginning of each cut. Cutting edge inclination keeps the cutting edge from receiving this shock and prevents fracturing.  $3^\circ - 5^\circ$  in turning and  $10^\circ - 15^\circ$  in milling are recommended.

## HONING AND LAND

Honing and land are cutting edge shapes that maintain cutting edge strength. Honing can be round or chamfer type. The optimal honing width is approximately 1/2 of the feed. Land is the narrow flat area on the rake or flank face.

## Effects of Honing

1. Enlarging the honing increases cutting edge strength, tool life and reduces fracturing.
2. Enlarging the honing increases flank wear occurrence and shortens tool life. Honing size doesn't affect rake wear.
3. Enlarging the honing increases cutting resistance and chattering.

When to Decrease Honing Size
<input type="radio"/> When finishing with small depth of cut and small feed.
<input type="radio"/> Soft workpieces.
<input type="radio"/> When the workpiece or the machine have poor rigidity.

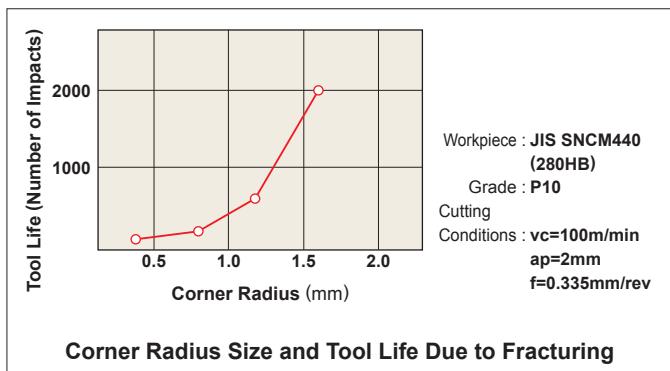

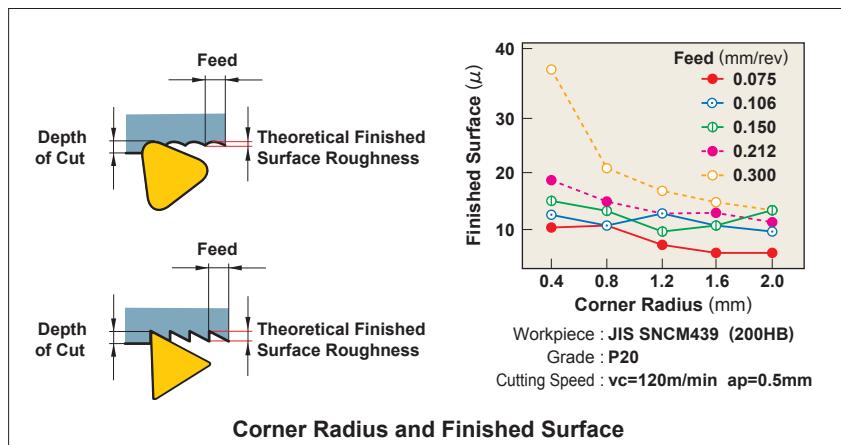

When to Increase Honing Size
<input type="radio"/> Hard workpieces.
<input type="radio"/> When the cutting edge strength is required such as for uncut surfaces and interrupted cutting.
<input type="radio"/> When the machine has high rigidity.

\*Cemented carbide, coated diamond, and indexable cermet inserts have round honing as standard.

# FUNCTION OF TOOL FEATURES FOR TURNING

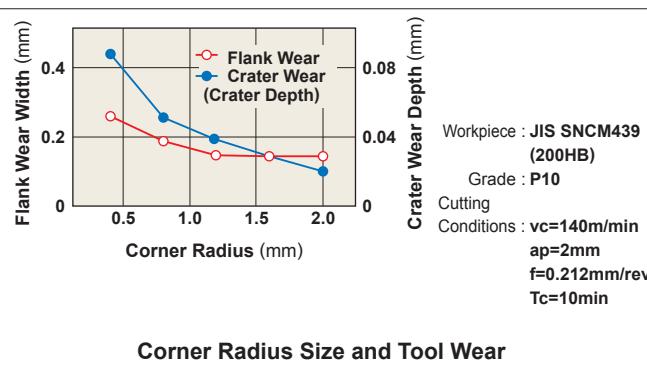

## RADIUS

Radius effects the cutting edge strength and finished surface. In general, a corner radius 2–3 times the feed is recommended.

Workpiece : JIS SNCM440 (280HB)  
Grade : P10  
Cutting Conditions :  $vc=100\text{m/min}$   
 $ap=2\text{mm}$   
 $f=0.335\text{mm/rev}$

Corner Radius Size and Tool Life Due to Fracturing

Workpiece : JIS SNCM439 (200HB)  
Grade : P10  
Cutting Conditions :  $vc=140\text{m/min}$   
 $ap=2\text{mm}$   
 $f=0.212\text{mm/rev}$   
 $T_c=10\text{min}$

## Effects of Corner Radius

- Increasing the corner radius improves the surface finish.
- Increasing the corner radius improves cutting edge strength.
- Increasing the corner radius too much increases the cutting resistance and causes chattering.
- Increasing the corner radius decreases flank and rake wear.
- Increasing the corner radius too much results in poor chip control.

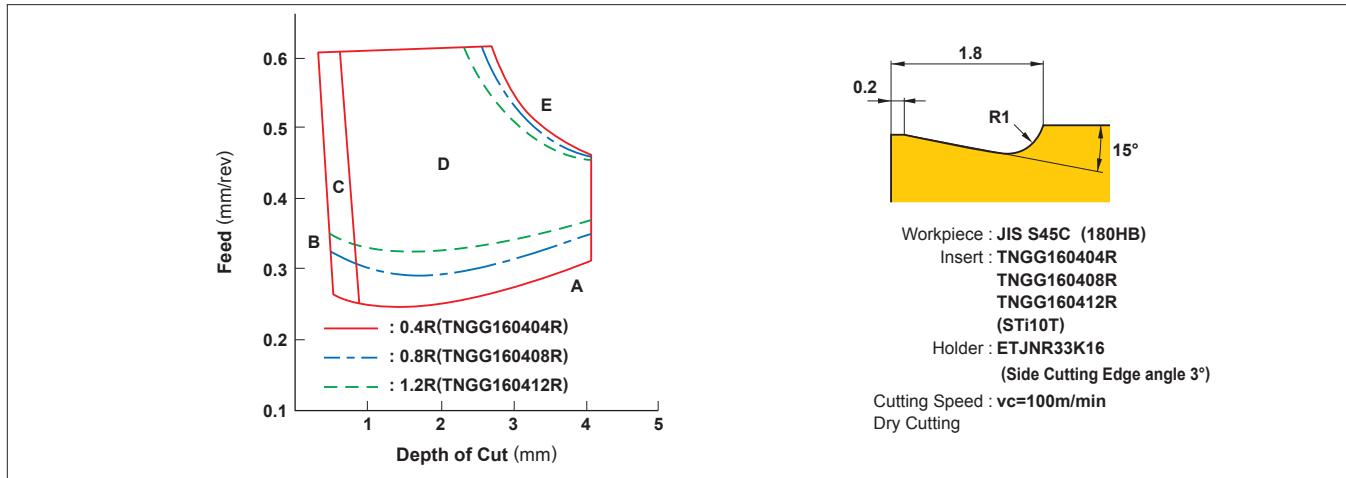

## When to Decrease Corner Radius

- Finishing with small depth of cut.
- Thin, long workpieces.
- When the machine has poor rigidity.

## When to Increase Corner Radius

- When the cutting edge strength is required such as in interrupted cutting and uncut surface cutting.
- When roughing a workpiece with large diameter.
- When the machine has high rigidity.

## Corner Radius and Chip Control Range

(Note) Please refer to page Q004 for chip shapes (A, B, C, D, E).

# FORMULAE FOR CUTTING POWER

## CUTTING POWER (Pc)

$$P_c = \frac{ap \cdot f \cdot vc \cdot K_c}{60 \times 10^3 \times \eta} \text{ (kW)}$$

Pc (kW) : Actual Cutting Power  
 f (mm/rev) : Feed per Revolution  
 Kc (MPa) : Specific Cutting Force

ap (mm) : Depth of Cut  
 vc (m/min) : Cutting Speed  
 $\eta$  : (Machine Coefficient)

(Problem) What is the cutting power required for machining mild steel at cutting speed 120m/min with depth of cut 3mm and feed 0.2mm/rev (Machine coefficient 80%) ?

(Answer) Substitute the specific cutting force Kc=3100MPa into the formula.

$$P_c = \frac{3 \times 0.2 \times 120 \times 3100}{60 \times 10^3 \times 0.8} = 4.65 \text{ (kW)}$$

### Kc

Work Material	Tensile Strength(MPa) and Hardness	Specific Cutting Force Kc (MPa)				
		0.1 (mm/rev)	0.2 (mm/rev)	0.3 (mm/rev)	0.4 (mm/rev)	0.6 (mm/rev)
Mild Steel	520	3610	3100	2720	2500	2280
Medium Steel	620	3080	2700	2570	2450	2300
Hard Steel	720	4050	3600	3250	2950	2640
Tool Steel	670	3040	2800	2630	2500	2400
Tool Steel	770	3150	2850	2620	2450	2340
Chrome Manganese Steel	770	3830	3250	2900	2650	2400
Chrome Manganese Steel	630	4510	3900	3240	2900	2630
Chrome Molybdenum Steel	730	4500	3900	3400	3150	2850
Chrome Molybdenum Steel	600	3610	3200	2880	2700	2500
Nickel Chrome Molybdenum Steel	900	3070	2650	2350	2200	1980
Nickel Chrome Molybdenum Steel	352HB	3310	2900	2580	2400	2200
Hard Cast Iron	46HRC	3190	2800	2600	2450	2270
Meehanite Cast Iron	360	2300	1930	1730	1600	1450
Grey Cast Iron	200HB	2110	1800	1600	1400	1330

## CUTTING SPEED (vc)

$$vc = \frac{\pi \cdot D_m \cdot n}{1000} \text{ (m/min)}$$

vc (m/min) : Cutting Speed  
 Dm (mm) : Workpiece Diameter  
 $\pi$  (3.14) : Pi  
 n ( $\text{min}^{-1}$ ) : Main Axis Spindle Speed

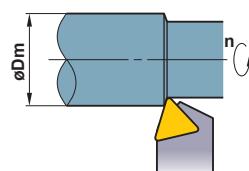

\*Divide by 1000 to change to m from mm.

(Problem) What is the cutting speed when main axis spindle speed is 700 $\text{min}^{-1}$  and external diameter is  $\phi 50$  ?

(Answer) Substitute  $\pi=3.14$ , Dm=50, n=700 into the formula.

$$vc = \frac{\pi \cdot D_m \cdot n}{1000} = \frac{3.14 \times 50 \times 700}{1000} = 110 \text{ m/min}$$

Cutting speed is 110m/min.

## FEED (f)

$$f = \frac{l}{n} \text{ (mm/rev)}$$

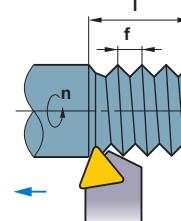

f (mm/rev) : Feed per Revolution  
 l (mm/min) : Cutting Length per Min.  
 n ( $\text{min}^{-1}$ ) : Main Axis Spindle Speed

(Problem) What is the feed per revolution when main axis spindle speed is 500 $\text{min}^{-1}$  and cutting length per minute is 120mm/min ?

(Answer) Substitute n=500, l=120 into the formula.

$$f = \frac{l}{n} = \frac{120}{500} = 0.24 \text{ mm/rev}$$

The answer is 0.24mm/rev.

## CUTTING TIME (Tc)

$$T_c = \frac{l_m}{I} \text{ (min)}$$

Tc (min) : Cutting Time  
 lm (mm) : Workpiece Length  
 I (mm/min) : Cutting Length per Min.

(Problem) What is the cutting time when 100mm workpiece is machined at 1000 $\text{min}^{-1}$  with feed = 0.2mm/rev ?

(Answer) First, calculate the cutting length per min. from the feed and spindle speed.

$$I = f \times n = 0.2 \times 1000 = 200 \text{ mm/min}$$

Substitute the answer above into the formula.

$$T_c = \frac{l_m}{I} = \frac{100}{200} = 0.5 \text{ min}$$

0.5 x 60=30 (sec.) The answer is 30 sec.

## THEORETICAL FINISHED SURFACE ROUGHNESS (h)

$$h = \frac{f^2}{8RE} \times 1000 (\mu\text{m})$$

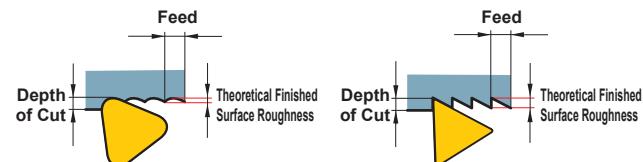

h ( $\mu\text{m}$ ) : Finished Surface Roughness  
 f (mm/rev) : Feed per Revolution  
 RE(mm) : Insert Corner Radius

(Problem) What is the theoretical finished surface roughness when the insert corner radius is 0.8mm and feed is 0.2mm/rev ?

(Answer) Substitute f=0.2mm/rev, RE=0.8 into the formula.

$$h = \frac{0.2^2}{8 \times 0.8} \times 1000 = 6.25 \mu\text{m}$$

The theoretical finished surface roughness is 6 $\mu\text{m}$ .

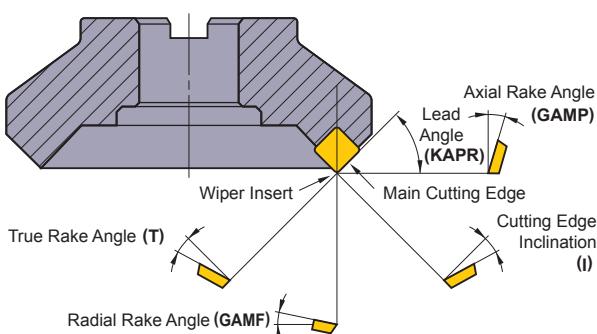

# TROUBLE SHOOTING FOR FACE MILLING

# FUNCTION OF TOOL FEATURES FOR FACE MILLING

## FUNCTION OF EACH CUTTING EDGE ANGLE IN FACE MILLING

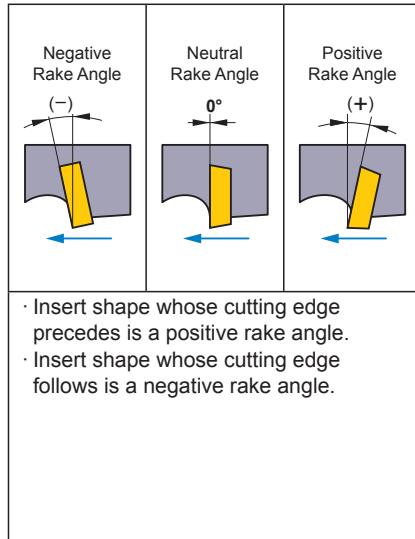

Each Cutting Edge Angle in Face Milling

Type of Angle	Symbol	Function	Effect
Axial Rake Angle	GAMP	Determines chip disposal direction.	<b>Positive :</b> Excellent machinability.
Radial Rake Angle	GAMF	Determines sharpness.	<b>Negative :</b> Excellent chip disposal.
Lead Angle	KAPR	Determines chip thickness.	<b>Small :</b> Thin chips and small cutting impact. <b>Large :</b> Large back force.
True Rake Angle	T	Determines actual sharpness.	<b>Positive (large) :</b> Excellent machinability. <b>Minimal welding.</b> <b>Negative (large) :</b> Poor machinability. <b>Strong cutting edge.</b>
Cutting Edge Inclination	I	Determines chip disposal direction.	<b>Positive (large) :</b> Excellent chip disposal. <b>Low cutting edge strength.</b>

## STANDARD INSERTS

### Positive and Negative Rake Angle

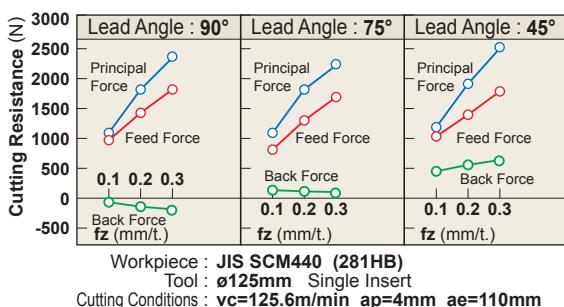

- Insert shape whose cutting edge precedes is a positive rake angle.
- Insert shape whose cutting edge follows is a negative rake angle.

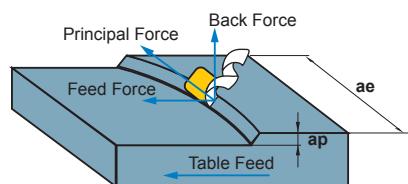

### Standard Cutting Edge Shape

Standard Cutting Edge Combinations	(+) Axial Rake Angle	(-) Axial Rake Angle	(+) Axial Rake Angle
	Radial Rake Angle	Radial Rake Angle	Radial Rake Angle

## LEAD ANGLE (KAPR) AND CUTTING CHARACTERISTICS

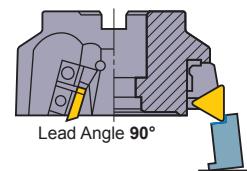

Cutting Resistance Comparison between Different Insert Shapes

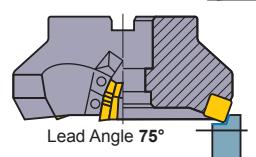

Three Cutting Resistance Forces in Milling

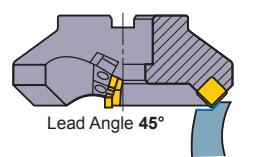

**Lead Angle 90°** Back force is in the minus direction. Lifts the workpiece when workpiece clamp rigidity is low.

**Lead Angle 75°** Lead angle 75° is recommended for face milling of workpieces with low rigidity such as thin workpieces.

**Lead Angle 45°** The largest back force. Bends thin workpieces and lowers cutting accuracy.  
\*Prevents workpiece edge chipping when cast iron cutting.

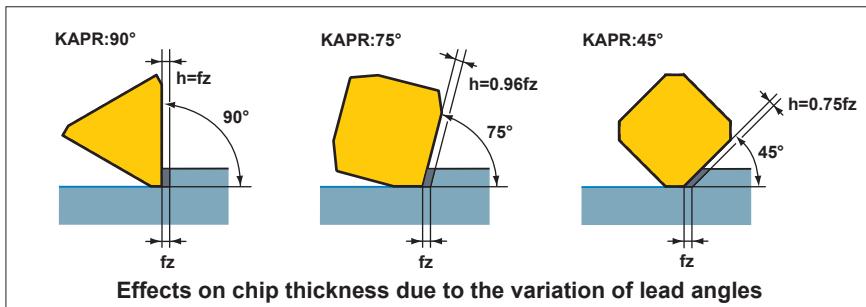

- \* Principal force : Force is in the opposite direction of face milling rotation.
- \* Back force : Force that pushes in the axial direction.
- \* Feed force : Force is in the feed direction and is caused by table feed.

# FUNCTION OF TOOL FEATURES FOR FACE MILLING

## ■ APPROACH ANGLE AND THE TOOL LIFE

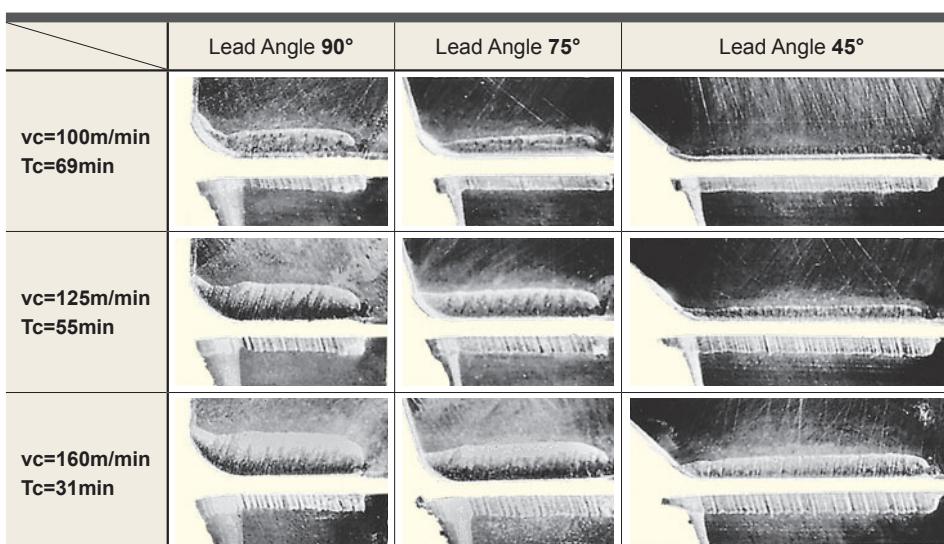

### ● Approach Angle and Chip Thickness

When the depth of cut and feed per tooth,  $f_z$ , are fixed, the smaller the corner angle (KAPR) is, then the thinner the chip thickness ( $h$ ) becomes (for a  $45^\circ$  KAPR, it is approx. 75% that of a  $90^\circ$  KAPR). This can be seen in below. Therefore as the KAPR increases, the cutting resistance decreases resulting in longer tool life. Note however, if the chip thickness is too large then the cutting resistance can increase leading to vibrations and shortened tool life.

### ● Approach Angle and Face Wear

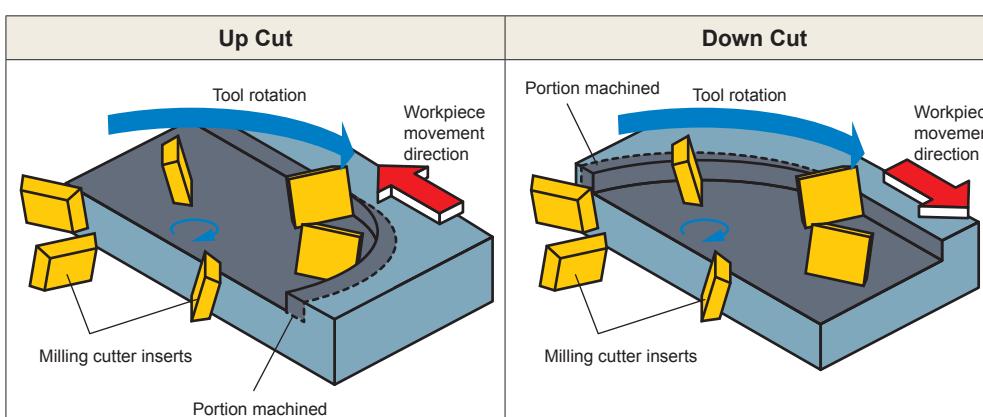

Below shows wear patterns for different lead angles. When comparing crater wear for  $90^\circ$  and  $45^\circ$  lead angles, it can be clearly seen that the crater wear for  $90^\circ$  lead angle is larger.

Workpiece : SNCM439 287HB  
Tools : DC=125mm  
Insert : M20Cemented Carbide  
Cutting Conditions :  $ap=3.0\text{mm}$   
 $ae=110\text{mm}$   
 $fz=0.2\text{mm/t.}$   
Dry Cutting

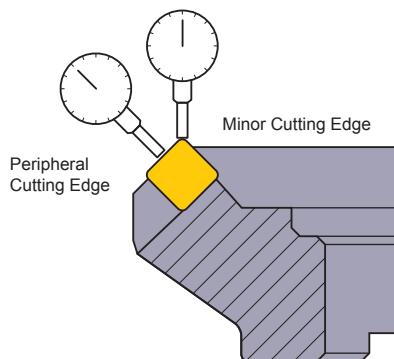

## ■ UP AND DOWN CUT (CLIMB) MILLING

When choosing a method to machine, up cutting or down cut milling (climb milling) is decided by the conditions of the machine tool, the milling cutter and the application. However, it is said that in terms of tool life, down cut (climb) milling is more advantageous.

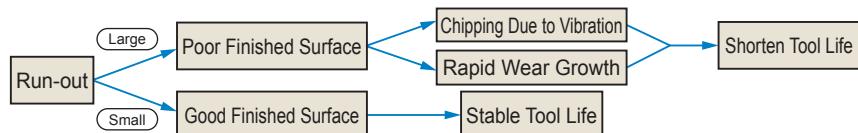

## FINISHED SURFACE

### Cutting Edge Run-out Accuracy

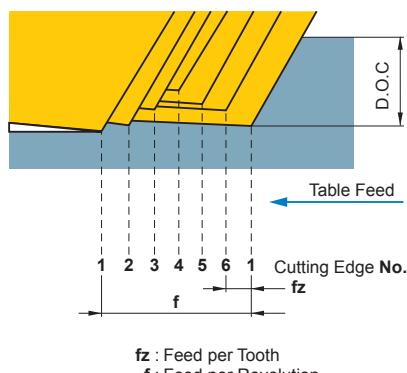

Cutting edge run-out accuracy of indexable inserts on the cutter body greatly affects the surface finish and tool life.

**Cutting Edge Run-out and Accuracy in Face Milling**

### Improve Finished Surface Roughness

Since Mitsubishi Materials' normal sub cutting edge width is 1.4mm, and the sub cutting edges are set parallel to the face of a milling cutter, theoretically the finished surface accuracy should be maintained even if run-out accuracy is low.

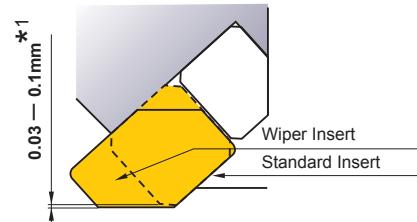

#### Actual Problems

- Cutting edge run-out.
- Sub cutting edge inclination.
- Milling cutter body accuracy.
- Spare parts accuracy.
- Welding, vibration, chattering.

#### Countermeasure

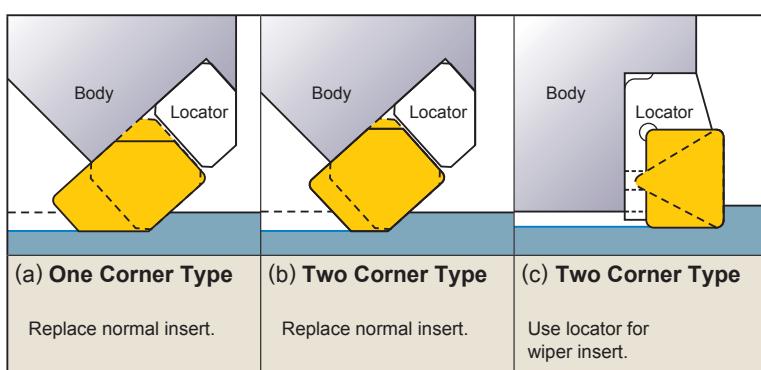

##### Wiper Insert

- Machine a surface that has already been per-machined in order to produce smooth finished surface.

- Replace one or two normal inserts with wiper inserts.
  - Wiper inserts be set to protrude by 0.03—0.1mm from the standard inserts.
- \*1. Value depends on the cutting edge and insert combination.

### How to Set a Wiper Insert

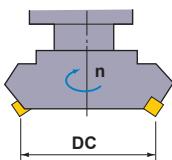

- Sub cutting edge length has to be longer than the feed per revolution.
- Too long sub cutting edge causes chattering.
- When the cutter diameter is large and feed per revolution is longer than the sub cutting edge of the wiper insert, use two or three wiper inserts.
- When using more than 1 wiper inserts, eliminate run-out of wiper inserts.
- Use a high hardness grade (high wear resistance) for wiper inserts.

# FORMULAE FOR FACE MILLING

## CUTTING SPEED (vc)

$$vc = \frac{\pi \cdot DC \cdot n}{1000} \text{ (m/min)}$$

\*Divide by 1000 to change to m from mm.

vc (m/min) : Cutting Speed  
 $\pi$  (3.14) : Pi

DC(mm) : Cutter Diameter  
 $n (\text{min}^{-1})$  : Main Axis Spindle Speed

(Problem) What is the cutting speed when main axis spindle speed is 350min<sup>-1</sup> and the cutter diameter is φ125?

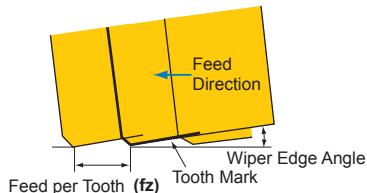

(Answer) Substitute  $\pi=3.14$ , DC=125, n=350 into the formula.

$$vc = \frac{\pi \cdot DC \cdot n}{1000} = \frac{3.14 \times 125 \times 350}{1000} = 137.4 \text{ m/min}$$

The cutting speed is 137.4m/min.

## FEED PER TOOTH (fz)

$$fz = \frac{vf}{z \cdot n} \text{ (mm/tooth)}$$

fz (mm/tooth) : Feed per Tooth  
vf (mm/min) : Table Feed per Min.  
n (min<sup>-1</sup>) : Main Axis Spindle Speed (Feed per Revolution  $f = z \times fz$ )

z : Insert Number

(Problem) What is the feed per tooth when the main axis spindle speed is 500min<sup>-1</sup>, number of insert is 10, and table feed is 500mm/min?

(Answer) Substitute the above figures into the formula.

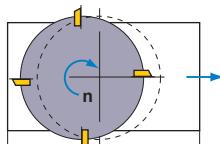

$$fz = \frac{vf}{z \cdot n} = \frac{500}{10 \times 500} = 0.1 \text{ mm/tooth}$$

The answer is 0.1mm/tooth.

## TABLE FEED (vf)

$$vf = fz \cdot z \cdot n \text{ (mm/min)}$$

vf (mm/min) : Table Feed per Min.      z : Insert Number  
fz (mm/tooth) : Feed per Tooth  
n (min<sup>-1</sup>) : Main Axis Spindle Speed

(Problem) What is the table feed when feed per tooth is 0.1mm/tooth, number of insert is 10, and main axis spindle speed is 500min<sup>-1</sup>?

(Answer) Substitute the above figures into the formula.

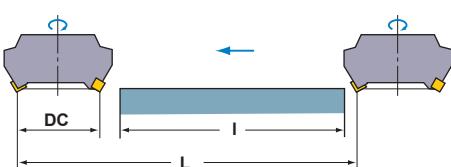

$$vf = fz \times z \times n = 0.1 \times 10 \times 500 = 500 \text{ mm/min}$$

The table feed is 500mm/min.

## CUTTING TIME (Tc)

$$Tc = \frac{L}{vf} \text{ (min)}$$

Tc (min) : Cutting Time  
vf (mm/min) : Table Feed per Min.  
L (mm) : Total Table Feed Length (Workpiece Length: (l)+Cutter Diameter : (DC))

(Problem) What is the cutting time required for finishing 100mm width and 300mm length surface of a cast iron (JIS FC200) block when the cutter diameter is φ200mm, the number of inserts is 16, the cutting speed is 125m/min, and feed per tooth is 0.25mm. (spindle speed is 200min<sup>-1</sup>)

Calculate table feed per min  $vf=0.25 \times 16 \times 200=800 \text{ mm/min}$

Calculate total table feed length.  $L=300+200=500 \text{ mm}$

Substitute the above answers into the formula.

$$Tc = \frac{500}{800} = 0.625 \text{ (min)}$$

0.625×60=37.5 (sec). The answer is 37.5 sec.

## CUTTING POWER (Pc)

$$P_c = \frac{ap \cdot ae \cdot vf \cdot K_c}{60 \times 10^6 \times \eta}$$

**Pc (kW)** : Actual Cutting Power  
**ae (mm)** : Cutting Width  
**Kc (MPa)** : Specific Cutting Force  
**ap (mm)** : Depth of Cut  
**vf (mm/min)** : Table Feed per Min.  
 **$\eta$**  : (Machine Coefficient)

(Problem) What is the cutting power required for milling tool steel at a cutting speed of 80m/min. With depth of cut 2mm, cutting width 80mm, and table feed 280mm/min by  $\phi 250$  cutter with 12 inserts. Machine coefficient 80%.

(Answer) First, calculate the spindle speed in order to obtain feed per tooth.

$$n = \frac{1000vc}{\pi DC} = \frac{1000 \times 80}{3.14 \times 250} = 101.91 \text{ min}^{-1}$$

$$\text{Feed per Tooth } fz = \frac{vf}{z \times n} = \frac{280}{12 \times 101.9} = 0.228 \text{ mm/tooth}$$

Substitute the specific cutting force into the formula.

$$P_c = \frac{2 \times 80 \times 280 \times 1800}{60 \times 10^6 \times 0.8} = 1.68 \text{ kW}$$

# END MILL TERMINOLOGY

## END MILL TERMINOLOGY

## COMPARISON OF SECTIONAL SHAPE AREA OF CHIP POCKET

## CHARACTERISTICS AND APPLICATIONS OF DIFFERENT-NUMBER-OF-FLUTE END MILLS

	2-flutes	3-flutes	4-flutes	6-flutes
Feature	Chip disposability is excellent. Suitable for sinking. Low cutting resistance.	Chip disposability is excellent. Suitable for sinking.	High rigidity	High rigidity. Superior cutting edge durability.
Fault	Low rigidity	Diameter is not easily measured.	Chip disposability is poor.	Chip disposability is poor.
Usage	Slotting, side milling, sinking etc. Wide range of use.	Slotting, side milling Heavy cutting, finishing	Shallow slotting, side milling Finishing	High Hardness Material Shallow slotting, side milling

# TYPES AND SHAPES OF END MILL

## Peripheral Cutting Edge

Kind	Shape	Feature
Ordinary Flute		Ordinary flute type is most generally used for the slotting, side milling, and the shoulder milling, etc. Can be used for roughing, semi-finishing, and the finishing.
Tapered Flute		A tapered flute is used for milling mould drafts and angled faces.
Roughing Flute		Because a roughing tooth has a wave-like form and produces small chips. Cutting resistance is low, and is suitable for roughing. Not suitable for finishing. The tooth face is re-grindable.
Formed Flute		A corner radius cutter is shown. An infinite range of form cutters can be produced.

## End Cutting Edge

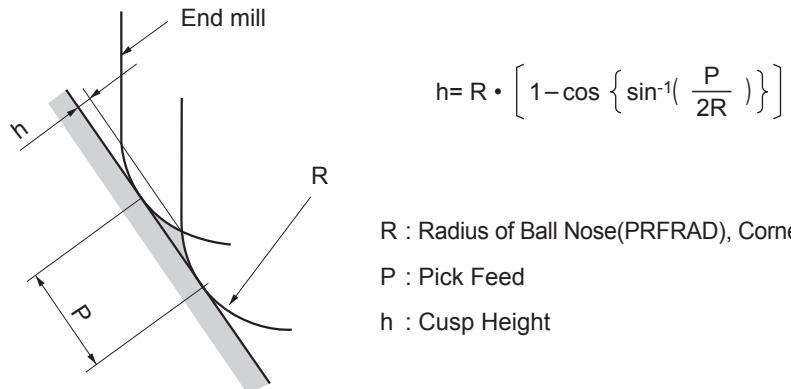

Kind	Shape	Feature
Square End (Centre With Hole)		This is generally used for slotting, side milling, and shoulder milling. Sinking is not possible. Grinding is center supported, making re-grinding accurate.
Square End (Centre Cut)		It is generally used for slotting, side milling, and shoulder milling. Vertical cutting can be performed. Re-grinding is possible.
Ball End		Suitable for profile machining and pick feed milling.
End Radius		For corner radius milling and contouring. Efficient small corner radius milling due to large diameter and small corner radius.

## Shank And Neck Parts

Kind	Shape	Feature
Standard (Straight Shank)		For general use.
Long Shank		For deep slotting and has a long shank, so that adjustment of the overhang is possible.
Long Neck		For deep slotting and small diameter end mills, also suitable for boring.
Taper Neck		For best performance in deep slotting and on mould drafts.

# DRILL WEAR AND CUTTING EDGE DAMAGE

## ■ DRILL WEAR CONDITION

The table below shows a simple drawing depicting the wear of a drill's cutting edge. The generation and the amount of wear differ according to the workpiece materials and cutting conditions used. But generally, the peripheral wear is largest and determines a drill tool life. When regrounding, the flank wear at the point needs to be ground away completely. Therefore, if there is large wear more material needs to be ground away to renew the cutting edge.

We : Chisel edge wear width

Wf : Flank Wear (The middle of the cutting edge)

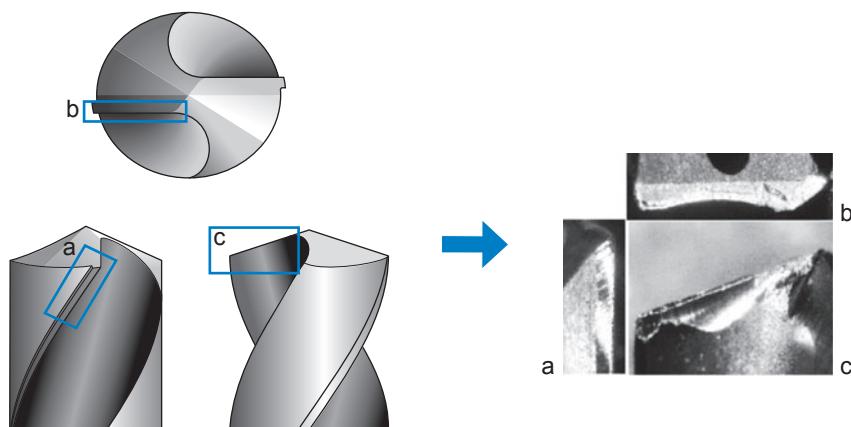

Wo : Outer corner wear width

Wm : Margin wear width

Wm' : Margin wear width (Leading edge)

## ■ CUTTING EDGE DAMAGE

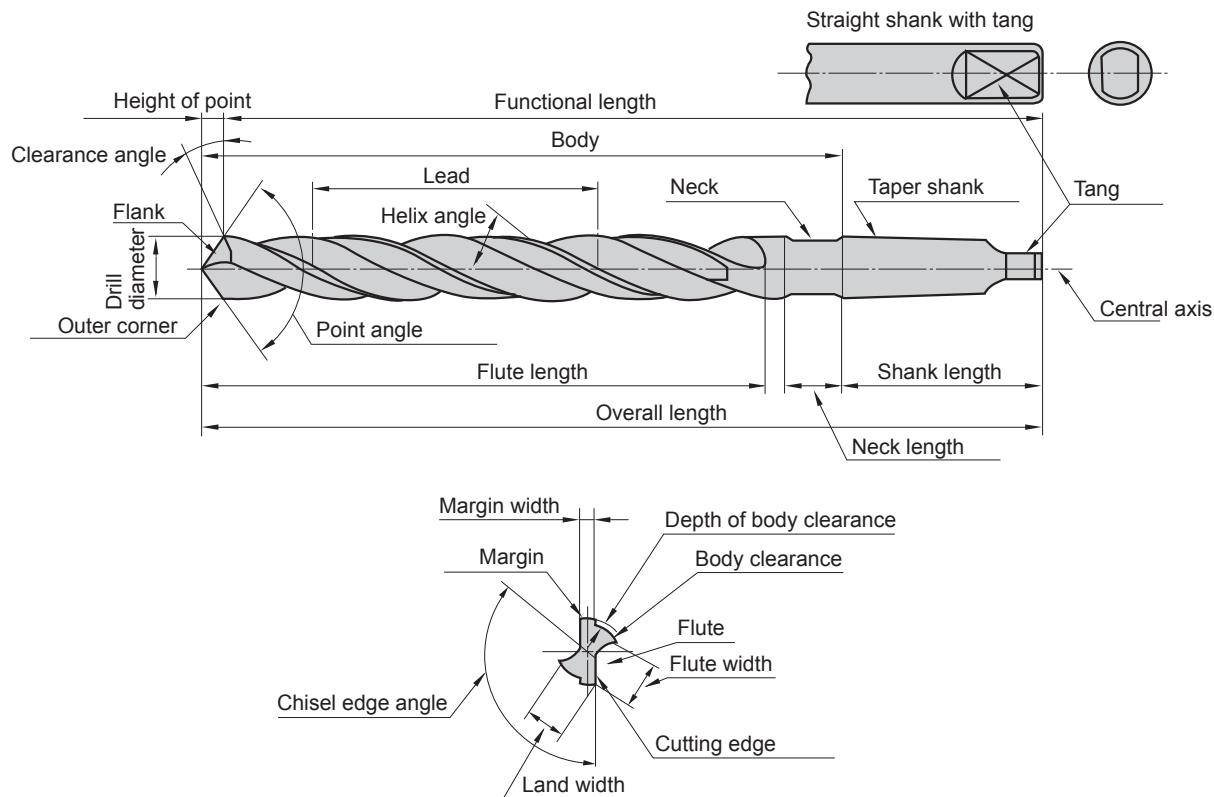

When drilling, the cutting edge of the drill can suffer from chipping, fracture and abnormal damage. In such cases, it is important to take a closer look at the damage, investigate the cause and take countermeasures.

Cutting edge damage

# DRILL TERMINOLOGY AND CUTTING CHARACTERISTICS

## NAMES OF EACH PART OF A DRILL

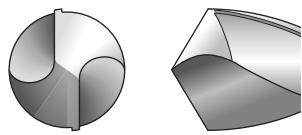

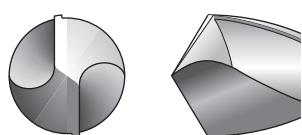

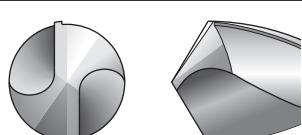

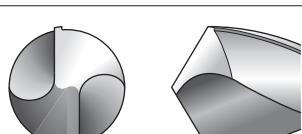

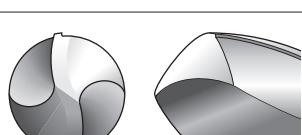

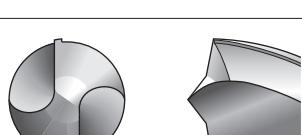

## SHAPE SPECIFICATION AND CUTTING CHARACTERISTICS

Helix Angle	Is the inclination of the flute with respect to the axial direction of a drill, which corresponds to the rake angle of a bit. The rake angle of a drill differs according to the position of the cutting edge, and it decreases greatly as the circumference approaches the centre. The chisel edge has a negative rake angle, crushing the work.  High-hardness material <b>Small ◀↔ Rake angle ▶ Large Soft material (Aluminium, etc.)</b>
Flute Length	It is determined by depth of hole, bush length, and regrinding allowance. Since the influence on the tool life is great, it is necessary to minimize it as much as possible.
Point Angle	In general, the angle is 118° which is set differently to various applications.  Soft material with good machinability <b>Small ◀↔ Point angle ▶ Large For hard material and high-efficiency machining</b>
Web Thickness	It is an important element that determines the rigidity and chip raking performance of a drill. The web thickness is set according to applications.  Small cutting resistance Low rigidity Good chip raking performance Machinable material } <b>Thin ◀↔ Web thickness ▶ Thick</b> { Large cutting resistance High rigidity Poor chip raking performance High-hardness material, cross hole drilling, etc.
Margin	The tip determines the drill diameter and functions as a drill guide during drilling. The margin width is determined in consideration of friction during hole drilled.  Poor guiding performance <b>Small ◀↔ Margin width ▶ Large Good guiding performance</b>
Diameter Back Taper	To reduce friction with the inside of the drilled hole, the portion from the tip to the shank is tapered slightly. The degree is usually represented by the quantity of reduction in the diameter with respect to the flute length, which is approx. 0.04–0.1mm. It is set at a larger value for high-efficiency drills and the work material that allows drilled holes.

## CUTTING EDGE GEOMETRY AND ITS INFLUENCE

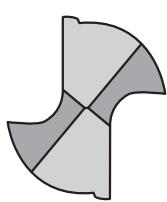

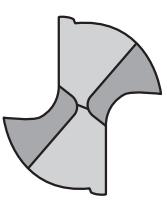

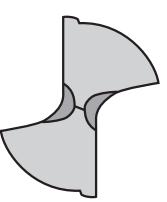

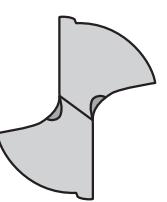

As shown in the table below, it is possible to select the most suitable cutting edge geometry for different applications. If the most suitable cutting edge geometry is selected then higher machining efficiency and higher hole accuracy can be obtained.

### Cutting Edge Shapes

Grinding name	Shape	Features and effect	Application
Conical		<ul style="list-style-type: none"> <li>The flank is conical and the clearance angle increases toward the centre of the drill.</li> </ul>	<ul style="list-style-type: none"> <li>General Use</li> </ul>
Flat		<ul style="list-style-type: none"> <li>The flank is flat.</li> <li>Easy grinding.</li> </ul>	<ul style="list-style-type: none"> <li>Mainly for small diameter drills.</li> </ul>
Three flank angles		<ul style="list-style-type: none"> <li>As there is no chisel edge, the results are high centripetal force and small hole oversize.</li> <li>Requires a special grinding machine.</li> <li>Surface grinding of three sides.</li> </ul>	<ul style="list-style-type: none"> <li>For drilling operations that require high hole accuracy and positioning accuracy.</li> </ul>
Spiral point		<ul style="list-style-type: none"> <li>To increase the clearance angle near the centre of the drill, conical grinding combined with irregular helix.</li> <li>S type chisel edge with high centripetal force and machining accuracy.</li> </ul>	<ul style="list-style-type: none"> <li>For drilling that requires high accuracy.</li> </ul>
Radial lip		<ul style="list-style-type: none"> <li>The cutting edge is ground radial with the aim of dispersing load.</li> <li>High machining accuracy and finished surface roughness.</li> <li>For through holes, small burrs on the base.</li> <li>Requires a special grinding machine.</li> </ul>	<ul style="list-style-type: none"> <li>Cast Iron, Aluminium Alloy</li> <li>For cast iron plates.</li> <li>Steel</li> </ul>
Centre Point drill		<ul style="list-style-type: none"> <li>This geometry has two-stage point angle for better concentricity and a reduction in shock when exiting the workpiece.</li> </ul>	<ul style="list-style-type: none"> <li>For thin sheet drilling.</li> </ul>

## WEB THINNING

The rake angle of the cutting edge of a drill reduces toward the centre, and it changes into a negative angle at the chisel edge. During drilling, the centre of a drill crushes the work, generating 50–70% of the cutting resistance. Web thinning is very effective for reduction in the cutting resistance of a drill, early removal of cut chips at the chisel edge, and better initial bite.

Shape				
Features	The thrust load substantially reduces, and the bite performance improves. This is effective when the web is thick.	The initial performance is slightly inferior to that of the X type, but the cutting edge is hard and the applicable range of work is wide.	Popular design, easy cutting type.	Effective when the web is comparatively thick.
Major Applications	General drilling and deep hole drilling.	Long life. General drilling and stainless steel drilling.	General drilling for steel, cast iron, and non-ferrous metal.	Deep hole drilling.

# DRILL TERMINOLOGY AND CUTTING CHARACTERISTICS

## ■ DRILLING CHIPS

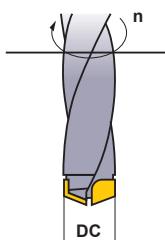

Types of Chips	Shape	Features and Ease of Raking
Conical Spiral		Fan-shaped chips cut by the cutting edge are curved by the flute. Chips of this type are produced when the feeding rate of ductile material is small. If the chip breaks after several turns, the chip raking performance is satisfactory.
Long Pitch		The generated chip comes out without coiling. It will easily coil around the drill.
Fan		This is a chip broken by the restraint caused by the drill flute and the wall of a drilled hole. It is generated when the feed rate is high.
Segment		A conical spiral chip that is broken before the chip grows into the long-pitch shape by the restraint caused by the wall of the drilled hole due to the insufficiency of ductility. Excellent chip disposal and chip discharge.
Zigzag		A chip that is buckled and folded because of the shape of flute and the characteristics of the material. It easily causes chip packing at the flute.
Needle		Chips broken by vibration or broken when brittle material is curled with a small radius. The raking performance is satisfactory, but these chips can pack closely creating.

# FORMULAE FOR DRILLING

## CUTTING SPEED (vc)

$$vc = \frac{\pi \cdot DC \cdot n}{1000} \text{ (m/min)}$$

\*Divide by 1,000 to change to m from mm.

vc (m/min) : Cutting Speed  
 $\pi$  (3.14) : Pi

DC (mm) : Drill Diameter  
 $n$  ( $\text{min}^{-1}$ ) : Main Axis Spindle Speed

(Problem) What is the cutting speed when main axis spindle speed is  $1350\text{min}^{-1}$  and drill diameter is 12mm?

(Answer) Substitute  $\pi=3.14$ , DC=12,  $n=1350$  into the formula

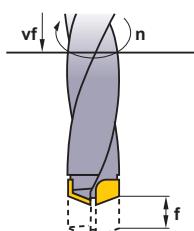

$$vc = \frac{\pi \cdot DC \cdot n}{1000} = \frac{3.14 \times 12 \times 1350}{1000} = 50.9\text{m/min}$$

The cutting speed is 50.9m/min.

## FEED OF THE MAIN SPINDLE (vf)

$$vf = fr \cdot n(\text{mm/min})$$

vf (mm/min) : Feed Speed of the Main Spindle (Z axis)  
fr (mm/rev) : Feed per Revolution  
n ( $\text{min}^{-1}$ ) : Main Axis Spindle Speed

(Problem) What is the spindle feed (vf) when the feed per revolution is 0.2mm/rev and main axis spindle speed is  $1350\text{min}^{-1}$ ?

(Answer) Substitute  $f=0.2$ ,  $n=1350$  into the formula

$$vf = f \cdot n = 0.2 \times 1350 = 270\text{mm/min}$$

The spindle feed is 270mm/min.

## DRILLING TIME (Tc)

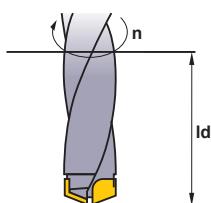

$$Tc = \frac{Id \cdot i}{n \cdot fr}$$

Tc (min) : Drilling Time  
n ( $\text{min}^{-1}$ ) : Spindle Speed  
Id (mm) : Hole Depth  
fr (mm/rev) : Feed per Revolution  
i : Number of Holes

(Problem) What is the drilling time required for drilling a 30mm length hole in alloy steel (JIS SCM440) at a cutting speed of 50m/min and a feed 0.15mm/rev?

(Answer) Spindle Speed  $n = \frac{50 \times 1000}{15 \times 3.14} = 1061.57\text{min}^{-1}$

$$Tc = \frac{30 \times 1}{1061.57 \times 0.15} = 0.188 \\ = 0.188 \times 60 \approx 11.3 \text{ sec}$$

# SURFACE ROUGHNESS

## SURFACE ROUGHNESS

(From JIS B 0601-1994)

Type	Code	Determination	Determination Example (Figure)
Arithmetical Mean Roughness	Ra	<p>Ra means the value obtained by the following formula and expressed in micrometer (<math>\mu\text{m}</math>) when sampling only the reference length from the roughness curve in the direction of the mean line, taking X-axis in the direction of mean line and Y-axis in the direction of longitudinal magnification of this sampled part and the roughness curve is expressed by <math>y=f(x)</math>:</p> $Ra = \frac{1}{l} \int_0^l \{f(x)\} dx$	
Maximum Height	Rz	<p>Rz shall be that only when the reference length is sampled from the roughness curve in the direction of the mean line, the distance between the top profile peak line and the bottom profile valley line on this sampled portion is measured in the longitudinal magnification direction of roughness curve and the obtained value is expressed in micrometer (<math>\mu\text{m}</math>).</p> <p>(Note) When finding Rz, a portion without an exceptionally high peak or low valley, which may be regarded as a flaw, is selected as the sampling length.</p> $Rz = Rp + Rv$	
Ten-Point Mean Roughness	RzJIS	<p>RzJIS shall be that only when the reference length is sampled from the roughness curve in the direction of its mean line, the sum of the average value of absolute values of the heights of five highest profile peaks (Yp) and the depths of five deepest profile valleys (Yv) measured in the vertical magnification direction from the mean line of this sampled portion and this sum is expressed in micrometer (<math>\mu\text{m}</math>).</p> $Rz_{JIS} = \frac{(Y_{p1} + Y_{p2} + Y_{p3} + Y_{p4} + Y_{p5}) + (Y_{v1} + Y_{v2} + Y_{v3} + Y_{v4} + Y_{v5})}{5}$	<p><math>Y_{p1}, Y_{p2}, Y_{p3}, Y_{p4}, Y_{p5}</math>: altitudes of the five highest profile peaks of the sampled portion corresponding to the reference length l.  <math>Y_{v1}, Y_{v2}, Y_{v3}, Y_{v4}, Y_{v5}</math>: altitudes of the five deepest profile valleys of the sampled portion corresponding to the reference length l.</p>

## RELATIONSHIP BETWEEN ARITHMETICAL MEAN (Ra) AND CONVENTIONAL DESIGNATION (REFERENCE DATA)

Arithmetical Mean Roughness Ra		Max. Height Rz	Ten-Point Mean Roughness RzJIS	Sampling Length for Rz • RzJIS l (mm)	Conventional Finish Mark
Standard Series	Cutoff Value $\lambda_c$ (mm)	Standard Series			
0.012 a	0.08	0.05s	0.05z	0.08	
0.025 a		0.1 s	0.1 z		
0.05 a	0.25	0.2 s	0.2 z		$\nabla\nabla\nabla\nabla\nabla$
0.1 a		0.4 s	0.4 z	0.25	
0.2 a		0.8 s	0.8 z		
0.4 a	0.8	1.6 s	1.6 z	0.8	
0.8 a		3.2 s	3.2 z		
1.6 a		6.3 s	6.3 z		$\nabla\nabla\nabla$
3.2 a	2.5	12.5 s	12.5 z		
6.3 a		25 s	25 z	2.5	$\nabla\nabla$
12.5 a		50 s	50 z		
25 a	8	100 s	100 z	8	$\nabla$
50 a		200 s	200 z		—
100 a	—	400 s	400 z	—	—

\*The correlation among the three is shown for convenience and is not exact.

\*Ra: The evaluation length of Rz and RzJIS is the cutoff value and sampling length multiplied by 5, respectively.

# TOOL WEAR AND DAMAGE

## CAUSES AND COUNTERMEASURES

Tool Damage Form	Cause	Countermeasure
<b>Flank Wear</b> 	<ul style="list-style-type: none"> <li>• Tool grade is too soft.</li> <li>• Cutting speed is too high.</li> <li>• Flank angle is too small.</li> <li>• Feed rate is extremely low.</li> </ul>	<ul style="list-style-type: none"> <li>• Tool grade with high wear resistance.</li> <li>• Lower cutting speed.</li> <li>• Increase flank angle.</li> <li>• Increase feed rate.</li> </ul>
<b>Crater Wear</b> 	<ul style="list-style-type: none"> <li>• Tool grade is too soft.</li> <li>• Cutting speed is too high.</li> <li>• Feed rate is too high.</li> </ul>	<ul style="list-style-type: none"> <li>• Tool grade with high wear resistance.</li> <li>• Lower cutting speed.</li> <li>• Lower feed rate.</li> </ul>
<b>Chipping</b> 	<ul style="list-style-type: none"> <li>• Tool grade is too hard.</li> <li>• Feed rate is too high.</li> <li>• Lack of cutting edge strength.</li> </ul>	<ul style="list-style-type: none"> <li>• Tool grade with high toughness.</li> <li>• Lower feed rate.</li> <li>• Increase honing. (Round honing is to be changed to chamfer honing.)</li> <li>• Use large shank size.</li> </ul>
<b>Fracture</b> 	<ul style="list-style-type: none"> <li>• Tool grade is too hard.</li> <li>• Feed rate is too high.</li> <li>• Lack of cutting edge strength.</li> </ul>	<ul style="list-style-type: none"> <li>• Tool grade with high toughness.</li> <li>• Lower feed rate.</li> <li>• Increase honing. (Round honing is to be changed to chamfer honing.)</li> <li>• Use large shank size.</li> </ul>
<b>Plastic Deformation</b> 	<ul style="list-style-type: none"> <li>• Tool grade is too soft.</li> <li>• Cutting speed is too high.</li> <li>• Depth of cut and feed rate are too large.</li> <li>• Cutting temperature is high.</li> </ul>	<ul style="list-style-type: none"> <li>• Tool grade with high wear resistance.</li> <li>• Lower cutting speed.</li> <li>• Decrease depth of cut and feed rate.</li> </ul>
<b>Welding</b> 	<ul style="list-style-type: none"> <li>• Cutting speed is low.</li> <li>• Poor sharpness.</li> <li>• Unsuitable grade.</li> </ul>	<ul style="list-style-type: none"> <li>• Increase cutting speed. (For JIS S45C, cutting speed 80m/min.)</li> <li>• Increase rake angle.</li> <li>• Tool grade with low affinity. (Coated grade, cermet grade)</li> </ul>
<b>Thermal Cracks</b> 	<ul style="list-style-type: none"> <li>• Expansion or shrinkage due to cutting heat.</li> <li>• Tool grade is too hard. *Especially in milling.</li> </ul>	<ul style="list-style-type: none"> <li>• Dry cutting. (For wet cutting, flood workpiece with cutting fluid)</li> <li>• Tool grade with high toughness.</li> </ul>
<b>Notching</b> 	<ul style="list-style-type: none"> <li>• Hard surfaces such as uncut surfaces, chilled parts and machining hardened layer.</li> <li>• Friction caused by jagged shape chips. (Caused by small vibration)</li> </ul>	<ul style="list-style-type: none"> <li>• Tool grade with high wear resistance.</li> <li>• Increase rake angle to improve sharpness.</li> </ul>
<b>Flaking</b> 	<ul style="list-style-type: none"> <li>• Cutting edge welding and adhesion.</li> <li>• Poor chip disposal.</li> </ul>	<ul style="list-style-type: none"> <li>• Increase rake angle to improve sharpness.</li> <li>• Enlarge chip pocket.</li> </ul>
<b>Flank Wear Fracture</b> * Damage for polycrystallines 	<ul style="list-style-type: none"> <li>• Damage due to the lack of strength of a curved cutting edge.</li> </ul>	<ul style="list-style-type: none"> <li>• Increase honing.</li> <li>• Tool grade with high toughness.</li> </ul>
<b>Crater Wear Fracture</b> * Damage for polycrystallines 	<ul style="list-style-type: none"> <li>• Tool grade is too soft.</li> <li>• Cutting resistance is too high and causes high cutting heat.</li> </ul>	<ul style="list-style-type: none"> <li>• Decrease honing.</li> <li>• Tool grade with high wear resistance.</li> </ul>

# CUTTING TOOL MATERIALS

The table below shows the relationship between various tool materials, in relation with hardness on a vertical axis and toughness on a horizontal axis. Today, cemented carbide, coated carbide and TiC-TiN-based cermet are key tool materials in the market. This is because they have the best balance of hardness and toughness.

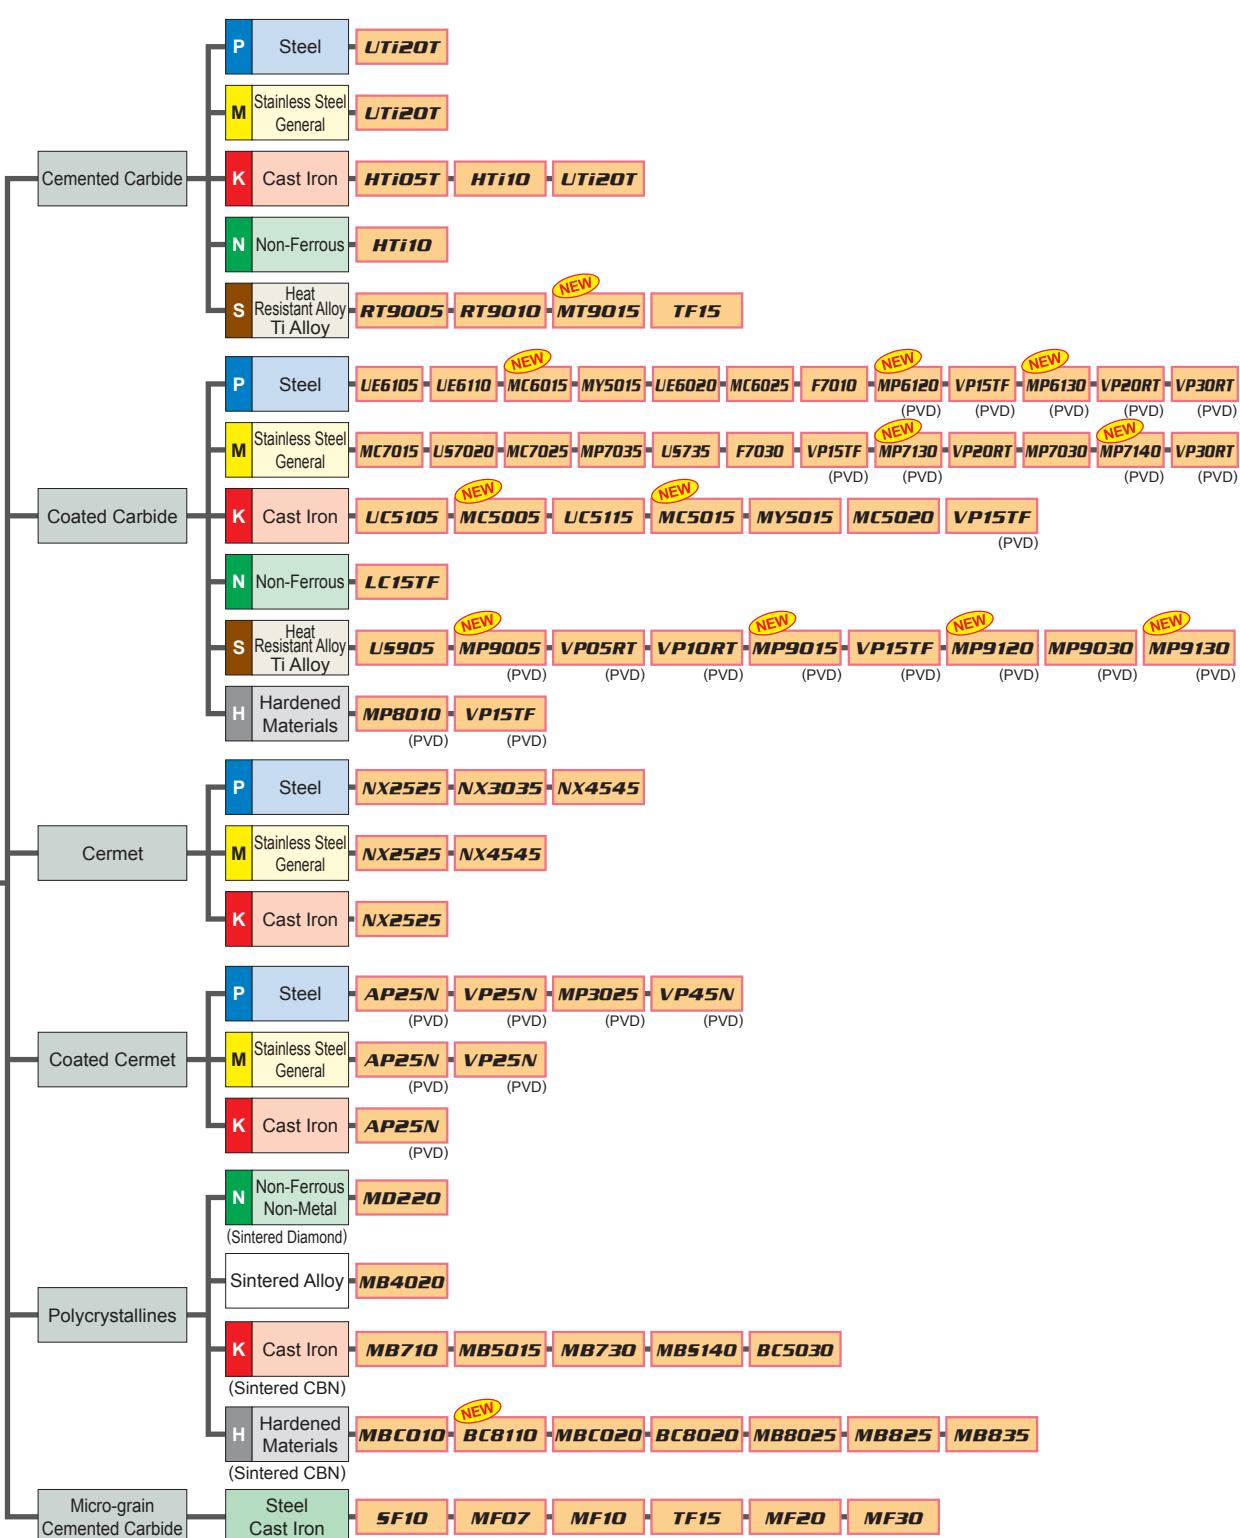

## GRADE CHARACTERISTICS

Hard Materials	Hardness (HV)	Energy Formation (kcal/g·atom)	Solubility in Iron (%.1250°C)	Thermal Conductivity (W/m·K)	Thermal Expansion ( $\times 10^{-6}/\text{K}$ )*	Tool Material
Diamond	>9000	–	Highly Soluble	2100	3.1	Sintered Diamond
CBN	>4500	–	–	1300	4.7	Sintered CBN
Si <sub>3</sub> N <sub>4</sub>	1600	–	–	100	3.4	Ceramics
Al <sub>2</sub> O <sub>3</sub>	2100	-100	÷0	29	7.8	Ceramics Cemented Carbide
TiC	3200	-35	< 0.5	21	7.4	Cermet Coated Carbide
TiN	2500	-50	–	29	9.4	Cermet Coated Carbide
TaC	1800	-40	0.5	21	6.3	Cemented Carbide
WC	2100	-10	7	121	5.2	Cemented Carbide

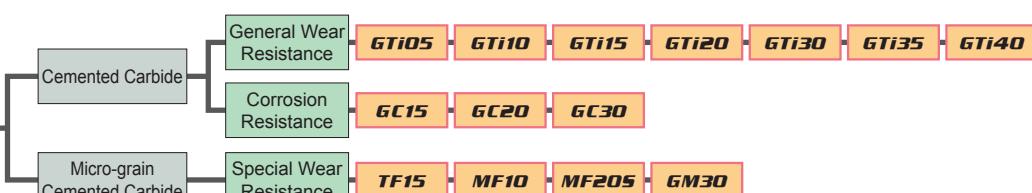

\*1 W/m·K =  $2.39 \times 10^{-3}$  cal/cm·sec·°C
